PHP

Super Global (GET , POST)

- Make a form with these inputs (name , email)
 - Check if the user submit the form or not
 - Get data from super global \$_GET and put assign these data to variables
 - Display these variables in h3
- Make there links that send data through these links
 - The first link send (name=ameen)
 - The second link send ([email=ameen@gmail.com](mailto:ameen@gmail.com))
 - The third link send (phone=01142565236)
 - Receive these data and display them in h3

```
// name , price , quantity
$products = [
    ["product number 1",300,50],
    ["product number 2",250,1000],
    ["product number 3",30,1200],
    ["product number 4",1500,10],
    ["product number 5",450,300],
];
```

- According to previous code
 - Display these data in table
 - Add link to each tow that land to show-product.php page
 - Send id of every product through every link

- Check if the Id is sent or not
- Type the id of product in h1 (in show-product.php page)
- Make a previous example using form and method is post
 - Id in input:hidden with the value of id (imagin)
